

## Prices

**PRX-T<sub>33</sub>** for lightening pigmented skin, reducing fine lines and wrinkles, and skin rejuvenation. A complete PRX-T<sub>33</sub> procedure involves one treatment per week for 4 weeks. A 'one-off' treatment of PRX-T<sub>33</sub> is recommended every 6 months to maintain its stimulatory effects over the long term. To compliment the stimulatory and regenerative effects of PRX-T<sub>33</sub> on your skin, a daily regime of WiQo Smoothing Fluid and Facial Creme are both included with the price of the course.

<b>PRX-T<sub>33</sub></b>	x 4 Program	£600
	Maintenance Treatment ('one-off')	£180
<b>WiQo</b>	Smoothing Fluid	£75
<b>WiQo</b>	Facial Hydration Fluid	£75

## Biostimulation

PRX-T<sub>33</sub> is a skin bio-stimulation procedure, consisting of a patented blend of trichloroacetic acid (TCA), hydrogen peroxide and kojic acid. TCA is mostly associated with chemical peels, but in the case of PRX-T<sub>33</sub> this combination results in a completely different modality.

So how does PRX-T<sub>33</sub> work? Hydrogen peroxide alters the properties of TCA, so instead of sitting on the surface of the skin (its normal behaviour as a peel) the TCA penetrates deeper into the skin where it stimulates fibroblasts to naturally remodel the dermal layer by making more collagen and elastin. The thicker dermal layer is more effective at supporting and scaffolding the epidermis above, so outwardly we see a smoother and more supple skin. As it penetrates the skin, TCA self-neutralises and does not frost the surface, so there is no peeling, and no downtime with this procedure. Kojic acid evens skin tones and corrects photoaging by inhibiting the production of the pigment, melanin, which can create pigmentation issues such as sunspots, or solar keratoses.

## What to expect

**During the procedure:** Firstly, your practitioner will remove any makeup, and cleanse your skin. On your first appointment the procedure will begin with a Dermaplane facial, removing any vellus hair and dead skin cells from the surface. This allows the active products of PRX-T<sub>33</sub> to penetrate further, and less absorption by dead cells which would reduce the efficacy of PRX-T<sub>33</sub>. The face is divided into zones to include the forehead, cheeks, Crow's Feet, nose, upper lip, jaw line and chin\*. Specific amounts of PRX-T<sub>33</sub> are applied as drops to each area then pressed in with firm pressure to allow PRX-T<sub>33</sub> to enter the skin. You will feel a tingling sensation as PRX-T<sub>33</sub> is applied but this will subside by the time the next zone is treated. Finally, your skin is treated with a Facial Hydrating Creme to replace the hydrolipidic film of the skin's acid mantle, an important barrier function of your skin which helps to protect it from infection by pathogens.

**Immediately after the procedure:** Your skin may be slightly red for a short time after the procedure, and it will feel tight. There will be no peeling. You can apply makeup immediately if required.

## The benefits of PRX-T<sub>33</sub>

PRX-T<sub>33</sub> has a unique effect on the skin where it causes tightening, rejuvenation, and evens skin tones, all in one simple, painless procedure. PRX-T<sub>33</sub> also helps to reduce the appearance of scars, acne, stretch marks, and melasma, as well as slowing down the process of dermal ageing.

Unlike many aesthetic procedures, PRX-T<sub>33</sub> can be carried out on those with darker skin, without the risk of hyperpigmentation. The degree of skin pigmentation is measured by the Fitzpatrick Scale, which ranges from 1 to 6. Those with pale skin, blue eyes, blond hair and burn easily are Fitzpatrick 1, whereas olive skinned individuals with brown eyes, dark hair and rarely burn score 6. PRX-T<sub>33</sub> is suitable for all Fitzpatrick skin types.

Aesthetic procedures such as peels, remove the layer of dead skin cells on the surface, as these contain melanin, there is a risk of photosensitivity as the skin offers less protection against UV light. Hence some procedures are not advised in the summer months. **PRX-T<sub>33</sub> can be carried out all year round!**

## Pre-treatment advice

Apart from not wearing any makeup before the treatment, there are no specific measures to take, or products to avoid beforehand. Clearly the obvious recommendations to avoid excessive alcohol and smoking will always apply to any aesthetic treatment, as will a daily regime of oral Vitamin C\* to help collagen synthesis and benefit from its antioxidant properties. Remember to drink plenty of water to keep your skin hydrated.

\* Vitamin C is not stored in the body but is a powerful antioxidant and required to synthesise and stabilise collagen. We recommend a daily dose of 1000mg.

## PRX-T<sub>33</sub> and WiQo

PRX-T<sub>33</sub>\* is manufactured by WiQo in Milan. Its patented formula is relatively new here in the UK, however, it's currently one of the most popular aesthetic procedures for non-surgical facelifting, and over 2 million applications have been made in clinics around the world. WiQo products help to prevent further signs of aging in a non-invasive way, guaranteeing long-lasting effect.

\*PRX stands for peroxiredoxins, powerful antioxidant enzymes that breakdown free radicals such as hydrogen peroxide, which is also made naturally. Peroxiredoxin also stimulates the wound healing response by stimulating fibroblasts in the dermal layer to make collagen and elastin.

**WARNING - Both PRX and WiQo products are available to buy online ... beware, these online sites are not registered dispensers, so the content of the products are not guaranteed. Buy only from your practitioner as they are qualified by the U.K Distributor to dispense and perform this procedure.**

## PRX-T<sub>33</sub>

- ✓ No downtime.
- ✓ No peels.
- ✓ No needles.
- ✓ No pain.
- ✓ All skin types.
- ✓ All year round.
- ✓ Fitzpatrick 1 to 6.
